

Detect user's device and redirect to a mobile web

While working on mobile web, first is think about how to detect the user's device. If the user is using a mobile device, then you have to redirect to a mobile web, not a general long and 3 or 4 columns website.

In Apache web server, Browser ID, more correctly called User Agent IDs, is the environmental variable `HTTP_USER_AGENT`. In dot net server (ASPX), you can use a string variable `Request.UserAgent`.

Here is a great place you can find a whole list of the Mobile Browser ID strings, a.k.a. User Agent ID:
http://www.zytrax.com/tech/web/mobile_ids.html

JavaScript code use `navigator.userAgent`

User Agent
