

Dynamic Web Pages: PHP code + mySQL database

Note in year 2005—This dynamic web pages are using PHP and mySQL database. Thousands of product items and component pictures are stored in mySQL database. The web hosting provided by Smallbusiness yahoo which supports PHP and mySQL, and with build-in phpMyAdmin to administrate and manage data.

In this KNS website, the most powerful tool is the search tool. The search tool could filter out any keywords in the database data.

Note in year 2006—Since there are many open source tools written in PHP, I choose one of the famous CMS (content management system) Mambo v.4.6.1. to re-build the index page. The images below are the "before" and "after" screen shot as comparison. Only to re-build the front-end look and links. In this case, there are two different databases, one is the previous-build product item's database, another one is created for Mambo CMS to store content details.
